

Stakeholder:

- **User:** Any person who is able to create and edit a board

Terminology:

- **Board:** A collection of zero or more lists
- **List:** A collection of zero or more cards
- **Card:** A container of information about specific tasks

MUST Requirements (needed for passing)

Note that ALL minimal requirements have to be met to pass the course.

As a user, I want to be able to ...

- Use the app without registration, so that boards can be quickly accessed.
- Modify the board with multiple users, so that a board can be used by teams.
- See changes users made to the board live, so that the working with a group is easy.
- Drag and drop tasks, so that the board can be modified more easily and faster.
- Add cards with a title, so that new tasks can be added.
- Remove cards, so that old, redundant or finished tasks can be deleted.
- Add and remove lists, so that groups of relevant cards can quickly be organized.

As a developer, I want to be able to ...

- Treat the card as its own title, so that I have a clear way of identifying a card.
- Distinguish user boards by a unique key, so that I can manage multiple boards more easily.
- Separate client application instantiations, so that multiple users can use the board simultaneously.

SHOULD Requirements

Note that no SHOULD/COULD requirements can substitute mandatory requirements.

As a user, I want to be able to ...

- Join boards by a key, so that a board can be edited together with teammates.
- Set a card description, so that cards can be made more specific and easier to understand.
- Add/remove tags on cards, so that cards can be grouped by subject.
- Customize the board to my preferences by changing the background and/or tag colors, so that the board feels more personal.
- Use keyboard shortcuts, so that the mouse isn't required for navigation.
- Create boards that are password-protected, so that boards could be read only for some users.
- Change the password on a board, if I have write permission, so that the password isn't fixed.

COULD Requirements (these features are added by the team)

Finish the SHOULD requirements before starting with COULD.

As a user, I want to be able to ...

- Assign priorities to cards, so that they can easily be organized.
- Sort list of cards by different criteria such as priority, so that cards with the highest priority can easily be seen.
- Create and delete different priority levels, so that boards can customize this to fit the purpose.
- See metadata of a card (creator, editor, date of creation), so that it's clear what happened on a board.
- Get a default layout on board creation, so that projects can quickly be started on without having to create the initial list and card.
- Create new boards from existing templates, so that time can be saved setting up the board to fit preferences.
- Pin cards to the top or bottom of a list, so that the workflow can be more personalized.
